

## DUH Empiric Antibiotic Recommendations for Infections in HOSPITALIZED Adults

Obtain cultures before the first antibiotic dose whenever possible without undue delay in treatment  
Severe Penicillin (PCN) includes anaphylaxis, angioedema, shortness of breath, Stevens Johnson, or immediate hives  
Always refer to past or current cultures to help select appropriate therapy

| RESPIRATORY INFECTION                                                   |                                               |
|-------------------------------------------------------------------------|-----------------------------------------------|
| Infection                                                               | Treatment                                     |
| Pneumonia – Community acquired                                          | Ceftriaxone <b>AND</b> Azithromycin           |
| Pneumonia – Hospital acquired                                           | Vancomycin <b>AND</b> Piperacillin-tazobactam |
| Aspiration pneumonia with abscess or empyema (otherwise see CAP or HAP) | Ampicillin-sulbactam                          |
| Acute bacterial exacerbation of chronic bronchitis                      | Doxycycline                                   |

| SKIN, SOFT TISSUE, BONE INFECTION               |                                                                                                   |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Infection                                       | Treatment                                                                                         |
| SSTI, non-purulent                              | Cephalexin/Cefazolin                                                                              |
| SSTI, purulent (If mild, use oral MRSA therapy) | Vancomycin                                                                                        |
| Diabetic foot infections (DFI)                  |                                                                                                   |
| Mild (Local infection with erythema < 2 cm)     | Amoxicillin-clavulanate                                                                           |
| Moderate (Local infection with erythema > 2 cm) | Vancomycin <b>AND</b> Ceftriaxone <b>OR</b> Piperacillin-tazobactam (if Pseudomonas risk factors) |
| Associated with bite                            | Amoxicillin-clavulanate                                                                           |
| Osteomyelitis                                   | If stable, obtain culture before antibiotics.                                                     |

| FEBRILE NEUTROPENIA                                                                                                                            |                                                                     |

For patients with **SEVERE PENICILLIN** allergy, please refer to CustomID for antibiotic recommendations.

<sup>o</sup> MRSA and Pseudomonas risk factors include prior positive respiratory culture, or hospitalization and IV antibiotics in past 90 days

## Duke University Hospital Empiric Antibiotic Recommendations for Infections in OUTPATIENT Adults

Obtain cultures before the first antibiotic dose whenever possible without undue delay in treatment  
Severe Penicillin (PCN) includes anaphylaxis, angioedema, shortness of breath, Stevens Johnson, or immediate hives  
Always refer to past or current cultures to help select appropriate therapy
